C M Y K

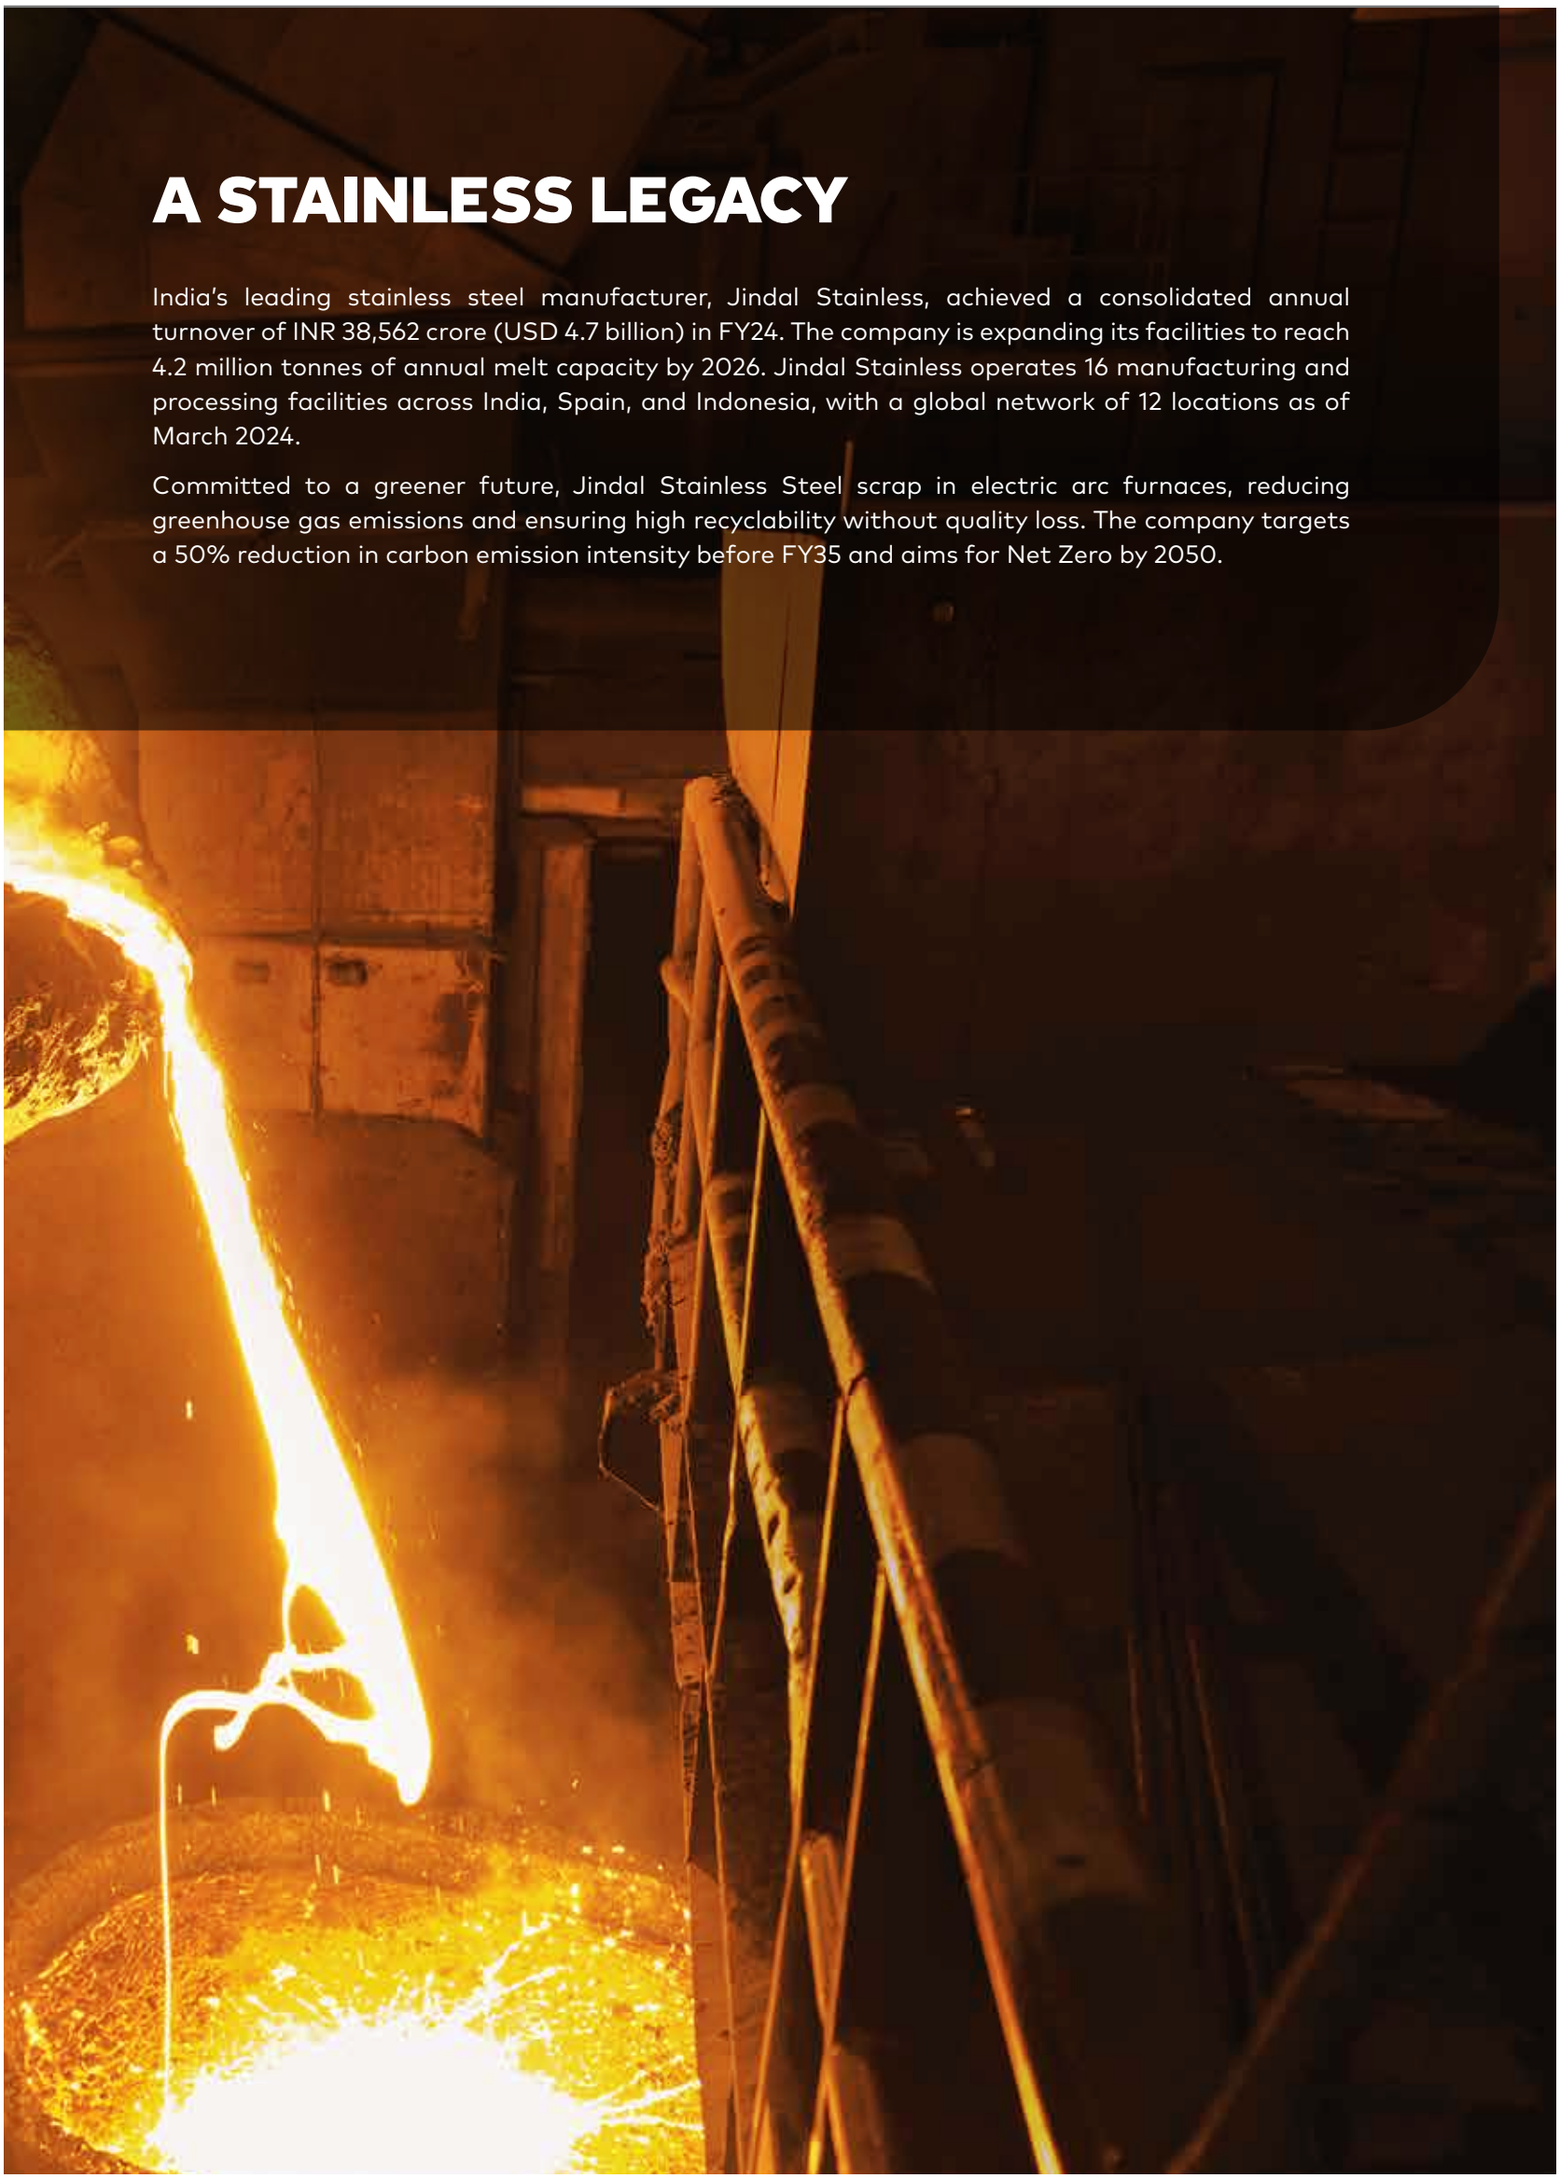
A STAINLESS LEGACY

India's leading stainless steel manufacturer, Jindal Stainless, achieved a consolidated annual turnover of INR 38,562 crore (USD 4.7 billion) in FY24. The company is expanding its facilities to reach 4.2 million tonnes of annual melt capacity by 2026. Jindal Stainless operates 16 manufacturing and processing facilities across India, Spain, and Indonesia, with a global network of 12 locations as of March 2024.

Committed to a greener future, Jindal Stainless Steel scrap in electric arc furnaces, reducing greenhouse gas emissions and ensuring high recyclability without quality loss. The company targets a 50% reduction in carbon emission intensity before FY35 and aims for Net Zero by 2050.



COMMITTED TO NET ZERO

- Net Zero emission by 2050 and 50% reduction in emissions by 2035
- Committed to taking Science Bases Target Initiative (SBTi) in our net zero journey in compliance with the Paris Agreement
- Responsible steel site certification: JSL is well underway towards achieving site certification from responsible steel

ENERGY EFFICIENCY

- Achieved ~3.1 lakh tCO_2e reduction over FY22–24through carbon-saving initiatives.
- Earned 30K+ E-Certificates by exceeding targets in PAT Cycles 1 & 2.
  - PAT Cycle 1: 12,687
  - PAT Cycle 2: 21,270

CAPTIVE RENEWABLE

- 7.3 MWp floating solar plant installed in Jajpur
- 4.2 MWp roof-top solar plant installed in Hisar
- 28 MWp rooftop solar plant being installed in Jajpur and Hisar
- Replaced fossil fuels with biofuels at Hisar Hot Rolling Mill, enabling 45,000+ tCO_2e abatement

RENEWABLE RTC (ROUND THE CLOCK)

- MoU with ReNew Power for 100 MW RTC renewable energy at Jajpur, cutting 4.35+ lakh tCO_2e annually
- Second MoU signed for 100 MW RTC renewable power at Hisar, with similar CO_2 abatement.
- All future power needs at JSL to be met with renewable sources.

GREEN HYDROGEN

- JSL commissions domestic stainless steel industry's first green hydrogen project for captive use.
  - Currently used in one HBA line, with plans for full rollout.
  - CO2 reduction potential of 2700 tCO2 annually
  - All existing HBA lines to move to Green Hydrogen by FY28

OUR SUSTAINABILITY ROAD MAP

STAINLESS STEEL

Stainless steel is a corrosion-resistant alloy containing a minimum of 10.5% chromium, which forms a thin, stable oxide layer on the surface. This protective layer prevents rusting and provides long-lasting durability, even in challenging environments.

To enhance its structure, strength, and corrosion resistance, additional alloying elements are incorporated. These include metals such as:

Nickel – improves ductility, toughness, and resistance to corrosion.

Molybdenum – increases resistance to pitting and crevice corrosion.

Titanium – stabilizes the structure and prevents carbide formation.

Copper – enhances resistance to certain acids and improves formability.

Manganese – adds strength and acts as a deoxidizer during production.

Non-metallic elements are also added to achieve specific properties, such as:

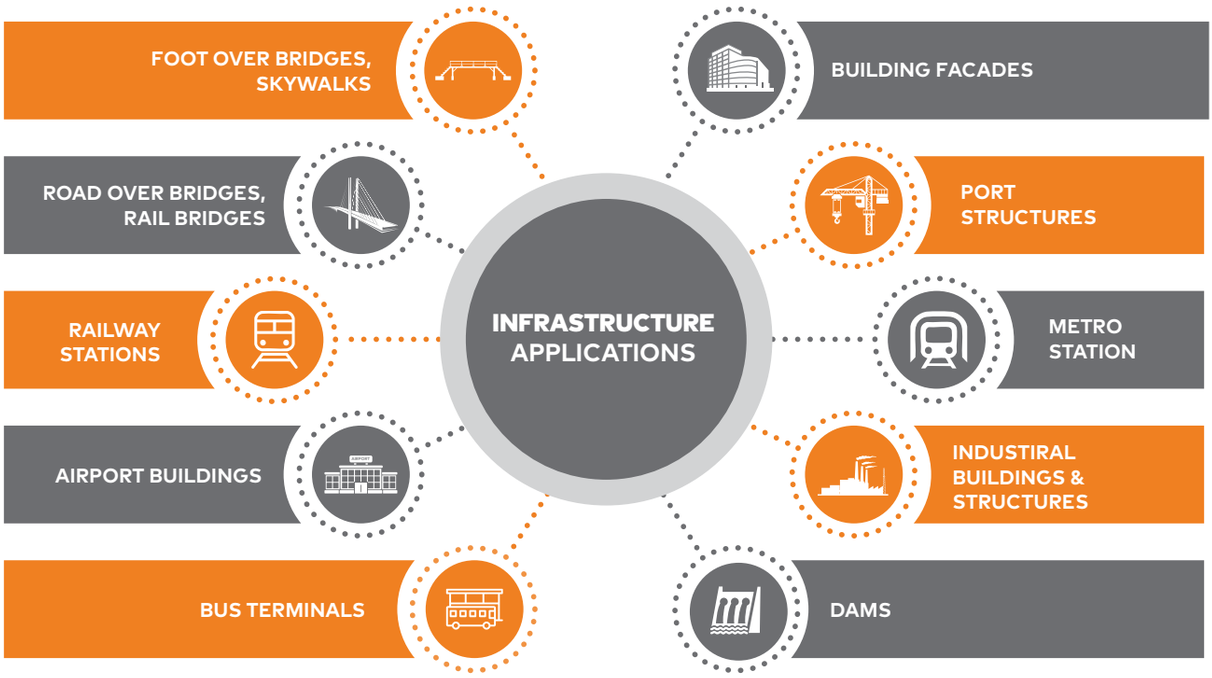
Carbon – increases hardness and tensile strength.

Nitrogen – enhances strength and pitting corrosion resistance.

The main requirement for stainless steel is corrosion resistance. However, depending on the application, other properties like strength, formability, and heat resistance are also optimized to meet specific performance standards.

ALL ABOUT STAINLESS STEEL : GRADES & PROPERTIES

VARIOUS APPLICATION OF STAINLESS STEEL IN INFRASTRUCTURE



HIGH-QUALITY STAINLESS STEEL FROM JINDAL STAINLESS LTD.

Stainless steel is available in a variety of grades, which are generally categorized into five main types:

AUSTENITIC – The most common type of steel, austenitic stainless steel contains nickel, manganese, nitrogen & sometimes molybdenum in addition to iron & chromium. These alloys cannot be hardened through heat treatments but can be work hardened.

MARTENSITIC – This stainless steel has carbon contents as high as 1%, which allows it to be hardened and tempered, similar to carbon and low-alloy steels.

FERRITIC – Ferritic steel features high chromium contents and low carbon contents (usually less than 0.10%). They cannot be work hardened and demonstrate good formability than austenitic steel. However, they offer magnetic properties, high corrosion resistance, and resistance to cracking due to corrosion.

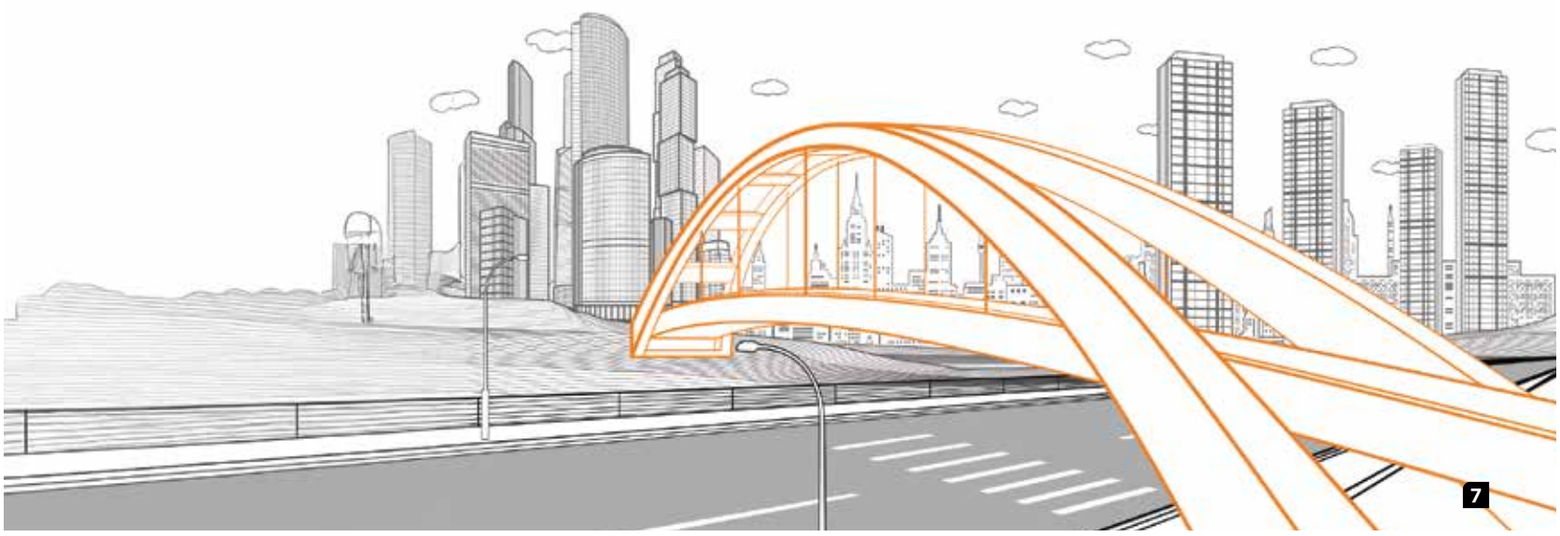
DUPLEX – Duplex steel features a material structure that is 50% austenitic and 50% ferritic.

This quality provides them with superior strength and corrosion resistance.

PRECIPITATION HARDENING (PH) – PH steels contain additional elements, such as aluminum, copper, or niobium, and undergo heat treatments, both of which enhance their material strength. As they are less likely to experience thermal distortion, they are suitable for the manufacturing of parts with intricate designs or that which require tight tolerances.

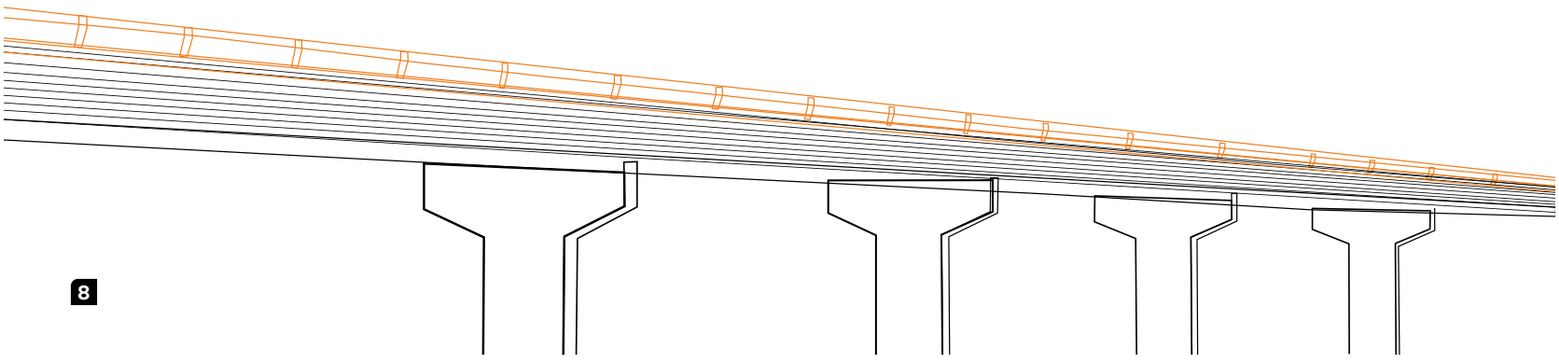
FERRITIC + MARTENSITIC - There are stainless steel grades that exhibit a dual-phase microstructure containing both ferritic and martensitic characteristics. This quality provides them with superior strength, high corrosion resistance and also offers magnetic properties.

STAINLESS STEEL FOR YOUR BUSINESS NEEDS



Stainless steel offers several beneficial properties when used in infrastructure applications, making it a suitable choice for various construction and architectural elements. Some of the key properties of stainless steel in infrastructure include:

1. **CORROSION RESISTANCE:** Stainless steel is highly resistant to corrosion, making it a durable choice for infrastructure components exposed to harsh environmental conditions, such as bridges, coastal structures, and buildings in corrosive environments.
2. **HIGH STRENGTH TO WEIGHT RATIO:** Stainless steel helps in attaining optimized structural design using the least of material and without compromising on the strength criterion. It provides flexibility to the designers in being innovative while being simplistic in detailing connections, spans and their assemblies.
3. **LOW MAINTENANCE:** Due to its resistance to corrosion, stainless steel requires minimal maintenance, reducing long-term costs and the need for frequent inspections and repairs.
4. **LONGEVITY:** Stainless steel has a long service life, which is essential for critical infrastructure components like bridges and structural elements. It can withstand exposure to weather, moisture, and other environmental factors for many years without significant degradation or sectional loss.
5. **HIGH STRENGTH**: Stainless steel has excellent mechanical properties, including high tensile strength and the ability to withstand heavy loads. This makes it suitable for structural applications, such as supporting beams, columns, long span girders and shear connections.
6. **AESTHETIC APPEAL:** Stainless steel's sleek and modern appearance can enhance the visual appeal of infrastructure projects. It is often used in architectural elements, railings, facades, and decorative features to create an attractive and contemporary look.
7. **FIRE RESISTANCE:** Certain grades of stainless steel, have good fire-resistant properties, making them suitable for fire safety applications, including fire escapes and fire protection systems.
8. **DURABILITY IN EXTREME TEMPERATURES:** Stainless steel can maintain its structural integrity in a wide range of temperatures, making it suitable for infrastructure projects in both hot and cold climates.
9. **RESISTANCE TO CHEMICAL EXPOSURE:** Stainless steel is usually inert and definitely more resistant to varied chemical exposure conditions, making it an obvious choice for structures exposed to extreme chemical environments.
10. **HYGIENIC PROPERTIES:** Stainless steel is easy to clean and maintains a hygienic surface, which is important in infrastructure components like public restrooms, transportation hubs, and healthcare facilities.
11. **SUSTAINABILITY:** Stainless steel is recyclable, which aligns with sustainable building practices and green infrastructure initiatives. Its long life span and the ability to reuse and recycle it, reduce the environmental impact of infrastructure projects.



LIFE CYCLE COSTING (LCC):

A bridge represents a long-term, multi-year investment. Following its planning, design, and construction, a bridge requires periodic maintenance and possibly repair or rehabilitation actions to ensure its continued function and safety. It is logical to consider the whole life cost instead of the initial cost to evaluate a particular bridge option. Life cycle costing (LCC) presents a rational method for carrying out the same.

Eventually the owner has to decide when a bridge must be replaced, hence designating the end of its useful life. This end typically comes decades and sometimes even centuries after the initial construction was completed. In simplest terms, the time between a bridge's construction and its replacement or removal from service is its service life. The sequence of actions and events and their outcomes: e.g., construction, usage, aging, damage, repair, renewal–that lead to the end of the service life and the condition of the bridge during its life compose the life cycle. Owners and Engineers must decide about what management strategy to follow, what materials and designs to use, what repairs to make and when they should be made, based on their expectations about what the subsequent costs and outcomes will be. LCC is a set of economic principles and computational procedures for comparing initial and future costs to arrive at the most economical strategy for ensuring that a bridge will provide the services for which it was intended. While considering the option of Stainless Steel to carry out LCC, the following parameters would be important to consider:

A. Initial cost increase is 20-25% over carbon steel.

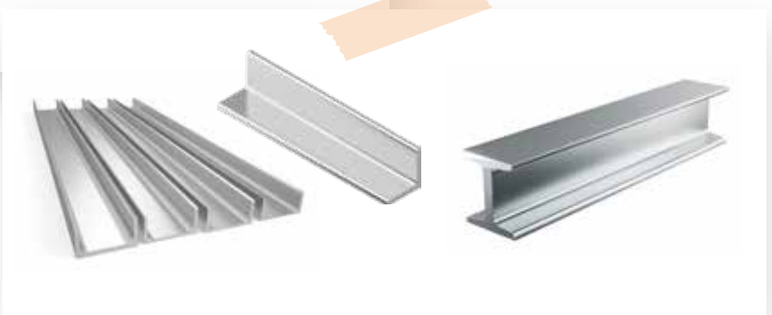
B. Low maintenance over carbon steel. However, only for aesthetic purposes, paint is recommended for utility Ferritic stainless steel.

C. Weight reduction of more than 25-30% can be achieved due to higher yield strength and light weight design.

D. Stainless steel is green material and helps in reducing carbon footprint.

JINDAL INFINITY
INFRA SOLUTION : PRODUCT RANGE

A. Plates



B. Fabricated Structural Sections
[Angles, Channels, H Beams, I Beams]

C. Welded Hollow Sections

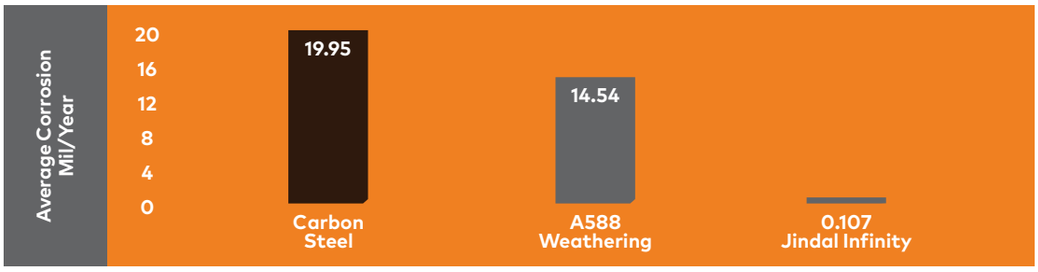
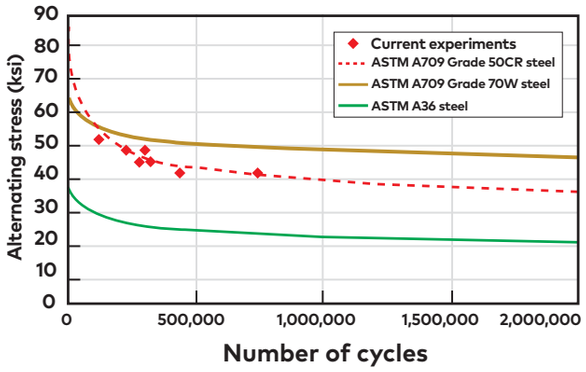
Upto 186x better corrosion resistance



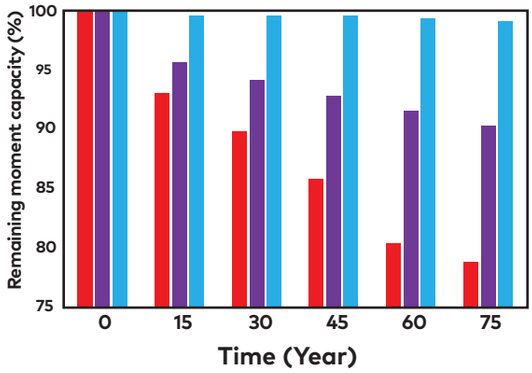
Corrosion performance as per SAE J2334 test consists of alternating wet/dry cycles with salt for 8 weeks, leads to low maintenance.

Fatigue Strength



Fatigue behavior ASTMA709 Grade 50CR steel in comparison to the other conventional structural steels (1 ksi = 6.9 MPa).

Moment Capacity Retention Vs Time



Percentage of drop in the moment capacity as a function of age.

Carbon Steel ■ Weathering Steel ■ Corrosion-resistant Steel

STAINLESS STEEL FOR VARIOUS BRIDGE DESIGNS

1. **Steel-Concrete Composite Bridges**

Combining the best of stainless steel and concrete, these bridges use built-up girders and concrete decks, often with shear connectors, to ensure the two materials work together efficiently. This type of bridge offers a highly efficient solution for clear spans ranging from **10m to 40m**. The **synergy between materials** enhances strength, reduces weight, and minimizes maintenance costs, making it an ideal choice for cost-effective and durable infrastructure.

2. **Bowstring-Arch Bridges**

Arch bridges use a curved structure that efficiently transfers loads, providing an elegant design and excellent strength. When designed with stainless steel, these bridges achieve enhanced **aesthetic appeal** and **structural integrity**. Stainless steel arch bridges are ideal for long spans ranging from **10m to 150m**, where the blend of beauty and performance is paramount. These bridges are not only functional but add to the **visual identity** of any area, with an emphasis on **long-lasting durability** and **minimal maintenance.**

3. **Truss Bridges**

Truss bridges feature a framework of stainless steel members arranged in triangles, converting loads into axial forces for maximum strength with minimal material. The **camelback truss** variant, with its distinctive arch, enhances load distribution and stability, making it ideal for longer spans. Stainless steel provides **superior fatigue resistance**, **corrosion resistance**, and **low maintenance**. Camelback truss bridges are well-suited for spans from **10m to 200m**, offering both **strength** and **aesthetic appeal**.

4. Open Web Girder Bridges

Open web girder bridges utilize steel girders with a "web" pattern, reducing material weight while maintaining high strength. They are commonly used for river and valley crossings, offering clear spans ranging from **30m to 200m**. The efficient use of **stainless steel** in this design allows for longer-lasting structures with **low maintenance** and **reduced need for frequent repairs**, contributing to **enhanced economic value** over time.

5. Cable-Stayed Bridges

Stainless steel cable-stayed bridges utilize **lighter pylons** made from stainless steel sections, which significantly reduce the **dead load** of the structure. This design allows for longer spans and lighter bridge structures, making them ideal for **spans of up to 1000m**. The **efficiency of stainless steel** results in **minimal maintenance** and **increased service life**, reducing the overall **cost of ownership**. With a sleek, modern appearance, cable-stayed bridges offer an **elegant and efficient solution** forlarge-scale infrastructure projects that demand strength, sustainability, and aesthetic appeal.

6. Stainless Steel Semi Through Girders Bridge - Potential Solution for water venting during heavy monsoon in cities:

a. During heavy monsoons, flooding has become a very common problem in the city's modern infrastructure. Timely water venting is very important for dewatering the cities during monsoon. The current design of concrete bridges over rivers, nallas crossing the cities have higher depths which creates hindrance for water venting. In this case, stainless steel semi through girder bridges can work as a potential solution.

b. Faster Execution: Prefabricated lighter stainless girders result in execution benefits at the site as heavier cranes, PSC casting yard, and special manpower is not required.

c. Also, if compared to typically 27-30 m PSC girders weighing ~85 MT, span lengths can be increased to 40 m using stainless steel girders weighing only ~32 MT. Resulting in reductions in the number of piers and hence reduction in the project timeline.

STRUCTURAL STAINLESS STEEL GIRDERS ALTERNATIVE TO PSC & RCC GIRDERS

Lighter, Modular and Project Time saving: A 40 m stainless steel Girder designed for special vehicle loading weighs around 30 MT whereas a 40-meter PSC Girder weighs around 120 T i.e. stainless steel girder can offer ~70% lighter superstructure weight.

For e.g. a typical 10 m wide bridge will use 5 girders overall weight of stainless steel girders per span will be 150 MT vs PSC Girders will weigh 600 MT.

The reduction is substantial weight results in following direct advantages of using stainless steel girders:

A. Optimised and leaner piers due to a substantial ~70% reduction in superstructure weight.

B. Faster Execution: Prefabricated lighter stainless girders result in execution benefits at the site as heavier cranes, PSC casting yard, and special manpower is not required.

C. Also, if compared to typically 27-30 m PSC girders weighing ~85 MT, span lengths can be increased to 40 m using stainless steel girders weighing only ~32 MT. Resulting in reductions in the number of piers and hence reduction in the project timeline.

NEW AGE STAINLESS STEEL FABRICATION FACILITY

PATALGANGA, MUMBAI

INTRODUCTION

Being pioneers in stainless steel, JSSL has now established a state-of-the-art fabrication unit exclusively for the infrastructure segment. JSSL Infra is an integrated stainless steel girders manufacturer in India, providing end-to-end solutions with precision and quality.

Strategically located in Patalganga, Mumbai, near major industrial corridors and JNPT Port, the facility ensures efficient logistics and timely delivery. Spread over 3.5 lakh sq.ft. with more than 1.1 lakh sq.ft. of covered area, the facility combines advanced technology, highly qualified and experienced engineers, and a dynamic workforce to deliver world-class stainless steel products.In-house NDT facilities and stringent quality control ensure the highest standards for all projects.

FACILITY HIGHLIGHTS

- **Total Area:** 3.5 lakh sq.ft. with 1.1 lakh sq.ft. covered fabrication area
- **Fabrication Bays:** Dedicated bays with overhead cranes for heavy lifting
- **Work Zones:** Separate zones for cutting, forming, welding, assembly, and finishing
- **Material Handling & Logistics:** vAdvanced systems for safe and efficient movement of materials
- **Clean & Controlled Areas:** For high-precision assembly and welding operations

QUALITY ASSURANCE & CERTIFICATIONS

- **In-house NDT Facilities:** DPT, RT, UT, and dimensional inspection
- **Welding Standards:** WPS/PQR/WPQR certified
- **Quality Standards:** Compliant with IS, ASTM, ASME, and customer-specific codes
- **Certifications:** ISO 9001

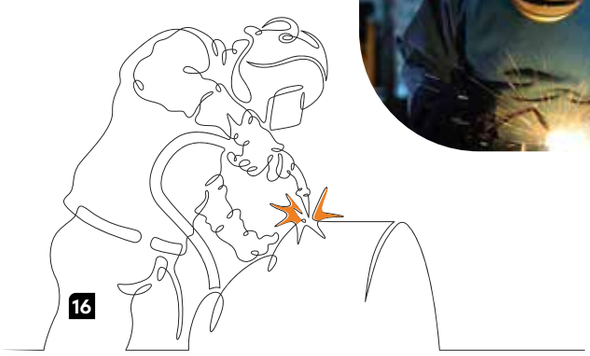
TECHNICAL EQUIPMENT INCLUDES:

- CNC Plasma Cutting
- Automatic Beam Welding
- Automatic Beam Assembly
- Automatic SAW (Submerged Arc Welding)
- Flange Straightener
- CNC Plate Drilling
- End Face Milling
- Stud Welding
- Automatic Shot Blasting Machine

WELDING OF IRS 350CR, IRS 450CR STAINLESS STEELS

Stainless Steel grades IRS 350CR and IRS 450CR are readily weldable via commonly used welding processes, both to itself as well as to carbon steel and other stainless steel grades, provided that appropriate consumable and fabrication procedures are utilized. The parts to be welded should be free of loose/thick scale, moisture, grease, and/or other foreign materials that could potentially influence weld quality. Qualification of the welding procedures per an appropriate code: eg. AWS D1.5, AWS D1.6 are recommended. As for welding any material, welder fume exposure should be minimized through use of ventilation, fume extractors, and/or respirators, as necessary for the given conditions. More specific welding related practices are described below:

- For thickness less than 0.5", weld heat input should be limited to a maximum of 25Kj/in to avoid diminished heat-affected zone (HAZ) toughness. For thicker plates, higher heat inputs to 70Kj/in. have been successfully used. Voltage and current should be set as the low to middle portion of the electrode manufacturer's range. Weld beads should be of the stronger type and of a size sufficient for the application without overwelding.
- The flux-cored arc (FCAW), gas metal arc (GMAW), shielded metal arc (SMAW) welding processes are generally suitable for IRS 350CR, IRS 450CR. Higher heat input processes like submerged arc (SAW) and the spray transfer modes of the other wire-fed processes should only be used after verification that the weld properties obtained are appropriate for the given application. Automatic / semi automatic SAW strongly recommended.
- ER309L T-1 is recommended for FCAW & for GMAW- ER 309L/ER309L Mo with gas mixture Ar-98% are recommended.
- Austenitic filler metals including 309L, 308L & 316L stainless are recommended for arc welding – IRS 350CR, IRS 450CR. Higher silicon versions of the fillers (309LSi, 308LSi, 316LSi) can be used, where necessary, to improve welding and/or weld appearance, albeit at some risk of increased weld metal crack sensitivity. Welding IRS 350CR and IRS 450CR to carbon steel should always be done employing 309L or 316L.



FASTENERS, BOLTS FOR STAINLESS STEEL STRUCTURES

ITEM	CODE & GRADE
Fasteners	ISO 3506 A2-80/A4-80 @ 800 MPa (UTS)
Nuts	ISO 3506 - 2 A2-80 - SS 304/A4-80 - SS 316
Shear Studs	ISO 3506 - 1 & ISO 13918 : 2008, Grade 304

All types of nuts & bolts including HSFG are domestically available.

Visit **www.jindalstainless.com** or contact at **infinity@jindalstainless.com** for suppliers of consumables, Fasteners & fabricated components.

STANDARDS AND CODES

STAINLESS STEEL SUCCESS STORIES IN INDIA

Bhayandar FOB, Western Railway

The Bhayandar foot over bridge in the Western Railways exemplifies a strategic shift towards employing stainless steel in infrastructure, specifically in bridge structures, showcasing distinct advantages over traditional carbon steel.

Primarily, IRS 350CR stainless steel provides superior corrosion resistance compared to carbon steel, a crucial factor in the coastal environment prevalent in many regions, including Maharashtra. This resistance ensures prolonged durability, reducing maintenance requirements and associated costs significantly.

Additionally, stainless steel's inherent strength and structural integrity enhance its reliability, ensuring the safety and longevity of the foot over bridge, a pivotal aspect for railway infrastructure.

Furthermore, stainless steel's resistance to rust and corrosion preserves the aesthetic appeal of the structure, maintaining its visual appeal over an extended period. The use of IRS 350CR stainless steel in the Bhayandar foot over bridge highlights its cost-effectiveness over a long term duration due to reduced maintenance needs and enhanced durability, ultimately contributing to a more sustainable and resilient infrastructure in the Railways network.

Himalaya FOB, CSTM - Mumbai

The Himalaya foot over bridge structure at Chhatrapati iShivaji Maharaj Terminus (CSTM) station in Mumbai is yet another landmark example of unparalleled advantages of stainless steel over conventional carbon steel.

Foremost, stainless steel's remarkable resistance to corrosion is pivotal in Mumbai's humid and coastal environment. This attribute ensures the extended durability of the structure, markedly reducing maintenance needs and associated costs over its lifecycle, making it a more sustainable and cost-effective choice compared to carbon steel.

Moreover, stainless steel's inherent strength and structural robustness provide superior load-bearing capabilities, ensuring the safety and reliability of the foot over bridge. This durability is crucial in supporting the substantial foot traffic typical of Mumbai's bustling transportation hubs.

Naupada & Srikakulam FOB

Utilizing stainless steel in the Naupada and Srikakulam foot over bridges within Waltair Division near the coastline was a major fillip to prove the distinct advantages over carbon steel. This choice demonstrates a cost-effective and resilient solution for constructing durable infrastructure in the coastal railway network of the Waltair Division.

Mrinal Tai Goregaon MINOR Bridge

The slum peninsula of Mumbai has over 440 bridges to facilitate the connectivity of its 12.5 million citizens. The Mrinal Tai Goregaon Flyover is a massive infrastructure project aimed at easing congestion in India's most populous city. The project has been executed in several phases. Recently an extension to the flyover, the bridge over Walbert Nalla, at Oshiwara District Centre has been constructed to meet the long term needs of this rapidly developing suburb.

Brihan Mumbai Municipal Corporation (BMC), commissioned the project in 2021. The goal was to build a new bridge that could meet the demanding conditions for decades to come, including a combination of extreme weather, seawater and wastewater flowing below it. The new bridge demanded a material with high corrosion resistance and high strength. Duplex Stainless steel -2205 was an ideal candidate for the challenge.

All the girders and structural complements were made of duplex stainless steel 2205 (UNS S32205) manufactured and supplied by Jindal Stainless Ltd. The grade was chosen because of its high strength and its superior corrosion resistance provided by the nickel and molybdenum content.

Chemical Composition of SS Rebar Grade G (410 L) as per IS 16651:2017:

Chemical	C	Ni	Mn	Si	P	S	Cr	N
Min %							11	-
Max %	0.03	0.6	1	1	0.04	0.03	13.5	-

Mechanical Properties of High Strength Deformed Stainless Steel Bars and Wires as per IS 16651:2017:

S. No.	Properties	SS 500	SS 550	SS 600	SS 650
1	0.2 percent proof stress (Rp0.2), Min, N/mm2	500	550	600	650
2	Percentage elongation after fracture (A5), Min, on gauge length 5.65 √A, where A is the cross-sectional area of the test piece	16	14.5	10	10

Product Offering:

Diameter (mm)	8 mm to 32 mm
Standard Length	12 mtrs.

Policy from Ministry of Road Transport and Highways:
Use of stainless steel in bridges on National Highways and other centrally sponsored projects to be constructed in marine environment susceptible to severe corrosion.

NEED FOR STAINLESS STEEL REBARS

Stainless steel rebars play a pivotal role in modern construction owing to their exceptional corrosion resistance and durability. Unlike conventional carbon steel rebars, stainless steel rebars offer extended service life in structures exposed to corrosive environments such as marine settings, chemical plants, and infrastructure in coastal areas. Their resistance to rust and corrosion helps maintain the structural integrity of buildings and bridges over time, significantly reducing maintenance costs and the need for frequent repairs. These rebars contribute to enhanced safety and reliability in construction, ensuring structures remain robust and stable for longer periods while minimizing environmental impact through their recyclability, making them a sustainable choice for infrastructure development worldwide.

OTHER ADVANTAGES:

- It is highly resistant to corrosion from chloride ion
- It does not rely on the high alkalinity of concrete for protection
- Concrete cover can be reduced
- Concrete sealant, such as Silane, can be eliminated
- Concrete mix can be simplified to suit concrete design needs, not for rebar protection needs
- It improves durability
- It reduces maintenance and repair
- It can be used selectively for high risk elements cost-effectively
- It will eventually be recycled

WHAT TYPE OF STAINLESS STEEL CAN BE USED IN THE REINFORCEMENT OF CONCRETE?

There exists a diverse array of stainless steel alloy options for choosing rebars, designed to fulfil specific mechanical design requirements and anticipated environmental corrosiveness. Stainless steels encompass primarily five main groups: Austenitic, Ferritic, Duplex, Martensitic, and Precipitation-hardened steels. The selection of SS REBAR GRADE G Stainless Steel as a preferred material depends on various factors, including its corrosion resistance, expected longevity, and life cycle cost, ensuring it aligns well with the intended application and structural demands.

SS REBAR confirming to IS 16651: 2017 is currently used in various projects by different Govt. bodies in India including:

- **INDIAN RAILWAYS**
- **NHAI**
- **PWDs**
- **MMRDA**
- **MCGM**
- **MRIDCL**
- **Statue of Oneness (Adi Shankaracharya)**
- **RDSO – High Speed Rail Test Track**
- **Pamban Bridge**
- **Dr. Balasaheb Ambedkar Memorial and many more**

APPLICATIONS – STAINLESS STEEL REINFORCEMENT BARS

Highway Infrastructure

Stainless steel reinforcement finds application in highway infrastructure where corrosion could lead to early degradation of the road system, potentially causing significant economic consequences for the local community. Utilizing stainless steel allows the builder to essentially complete the construction efficiently, avoid subsequent repairs, and ensure long-term durability. Employing stainless steel reinforcement substantially extends the useful lifespan of the infrastructure, minimizing the need for frequent repairs or replacements.

- **BRIDGE STRUCTURE ELEMENTS**
- **DECK PANELS**
- **BARRIER WALLS AND CURBS**
- **SIDEWALKS AND MEDIANS**
- **DECK JOINT BLOCKOUTS**
- **ABUTMENTS ROOF SLABS, APPROACH SLABS AND WING WALLS**
- **BRIDGE PIERS AND PIER CAPS**
- **BARS PROJECTING FROM PRECAS**
- **ANCHORING SYSTEMS**
- **TUNNELS**
- **ALL OTHER CHLORIDE SPLASH ZONES**
- **HIGHWAY ELEMENTS**
- **LOAD TRANSFER DOWELS**
- **CONCRETE PAVEMENTS**

Marine Infrastructure

Stainless steel reinforcing is used for structures in a marine environment where corrosion could be an acute design challenge. By using stainless steel reinforcing, the useful life of a marine structures is dramatically increased.

- **MARINE STRUCTURES**
- **COASTAL BRIDGES**
- **PIERS**
- **WHARVES**
- **TUNNELS**

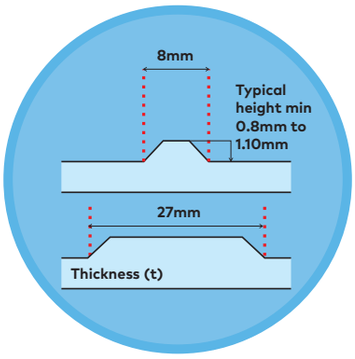
- **Thickness range -** 3mm to 8mm
- **Width Up to -** 1500mm
- **Finish -** Chequered

(Note: Any customized sizes can be catered as per mutual agreement)

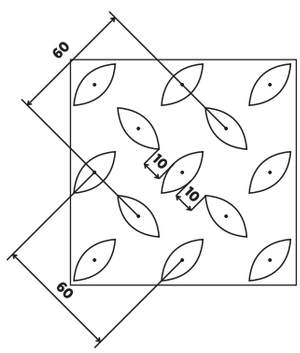


PATTERNED ALONG THE BEST GLOBAL STANDARDS

The pattern of this Stainless Steel Chequered Plate is in accordance with IS 3502 Pattern 1A.

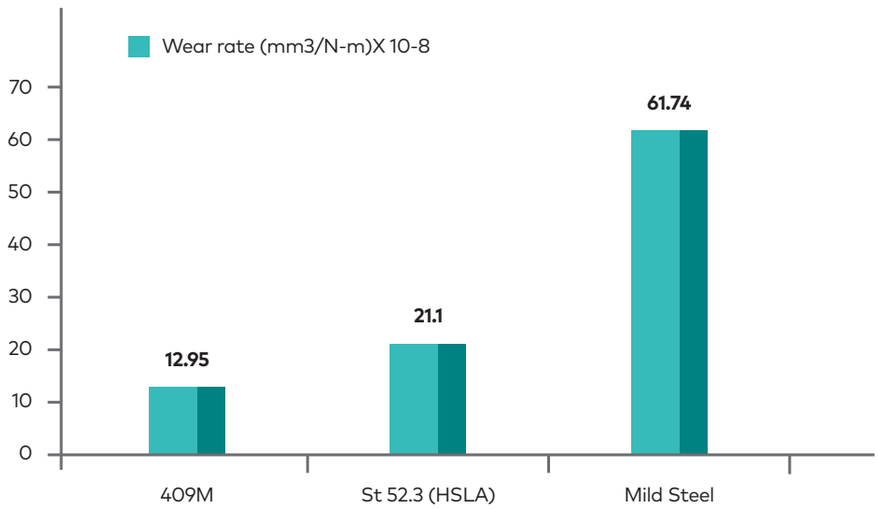
Dimensions of Bead*
Length – 27mm
Width – 8mm
Height – Min. 0.80mm

Number of Beads*
(100mm x 100mm):11
*Standard tolerance applies



UP TO 5 TIMES HIGHER WEAR RESISTANCE FOR HIGHER COST SAVINGS

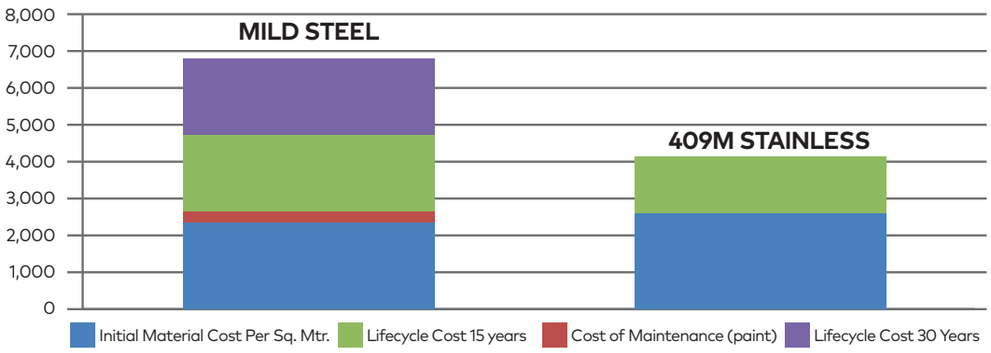
Grade 409M is known for its high wear resistance. Under the sliding wear test condition grade 409M is 1.6 times better than HSLA steel and 4.7 times better than normal mild steel.



SCAN TO VIEW THE BROCHURE

LOWER LIFECYCLE COST FOR A LIFETIME OF GROWTH

LCC OF SS 409M HRAP CHEQUERED VS MILD STEEL HF CHEQUERED OVER 30 YEARS LIFE



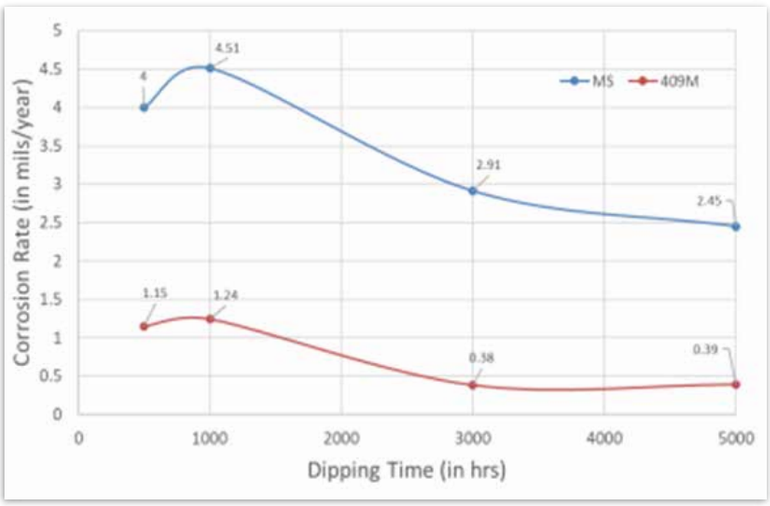
Supplying of anti-skid chequered plates for gangway, trolley refuge, man refuge, side pathway, etc. shall be confirming to latest IS 6911, ISS Symbol 409 M, minimum 6mm thick (excluding bead height) with flat bottom and top pattern confirming to IS 3502, 1A For, coastal/corrosive areas, thickness may be suitably increased depending upon severity of corrosion.

Appropriate matching stainless steel grade fasteners as recommended by manufacturer shall be used.

AVERAGE CORROSION RATE PER YEAR (Avg. Mils / year)						
TEST MEDIUM	500 hours		1000 hours		5000 hours	
	MS	409M	MS	409M	MS	409M
1% NaCl	3.16	0.61	3.31	0.75	2.17	0.07
3% NaCl		1.15	4.51	1.24	2.45	0.39

TEST RESULT FOR 5000 HOURS

- In **1%NaCl** Corrosion rate of MS is **31 times** more.
- In **3%NaCl** Corrosion rate of MS is **5 times** more.



INDIAN RAILWAYS GANGWAYS, PATHWAYS, TROLLY REFUGE, SIDE PATHWAYS

Recognizing the persistent maintenance challenges stemming from corrosion issues with the use of mild steel chequered plates along gangways and pathways, the Indian Railway took a decisive step towards enhancing durability and reducing upkeep expenses. After thorough observation and assessment, the decision was made to replace all mild steel plates with stainless steel chequered plates. This transition was underpinned by a strategic consideration of Life Cycle Cost (LCC) and various other factors. The shift to stainless steel not only mitigated the recurrent maintenance demands but also offered heightened resistance to corrosion, thereby ensuring prolonged longevity and structural integrity. This proactive measure embodies the Railway's commitment to improving infrastructure resilience while optimizing long-term operational efficiency.

Transformation at **Sampriti Setu, Eastern Railway – Howrah Division, West Bengal:** From Corroded Mild Steel to Resilient Stainless Steel Chequered Plates - A Bridge to Durability and Reliability

Revitalizing **Nalhati Bridge, Eastern Railway – Howrah Division, West Bengal:** Evolution from Corrosion-Prone Mild Steel to Enduring Stainless Steel Chequered Plates - Ensuring Longevity and Strength.

Art Applications

EDGE AHEAD WITH THE JSL EDGE

- Regular Supplier to Railways
- Approved by RDSO
- Wide Manufacturing Range
- State-of-the-art Technology
- Largest SS Manufacturer
- Fully Integrated Plant
- Socially Responsible Company
- Flexibility: 50 MT Heat
- Wide Marketing Network
- Environment Friendly Company
- Indian Railways' Most Trusted Fabrication Partner
- Chain of Service Centres

TIMELESS LANDMARK

ASSURED BY GENGUINE JINDAL SAATHI SEAL

Superior Finish

Corrosion Resistant

Jindal Saathi Seal Powered Stainless Steel Pipes & Tubes
for Gates, Rainlings, Furniture & more.
